}
};

```

4.3 Flow Models

- Maximum/Minimum flow with lower bound / Circulation problem
 - Construct super source S and sink T .
 - For each edge (x, y, l, u) , connect $x \rightarrow y$ with capacity $u - l$.
 - For each vertex v , denote by $in(v)$ the difference between the sum of incoming lower bounds and the sum of outgoing lower bounds.
 - If $in(v) > 0$, connect $S \rightarrow v$ with capacity $in(v)$, otherwise, connect $v \rightarrow T$ with capacity $-in(v)$.
 - To maximize, connect $t \rightarrow s$ with capacity ∞ (skip this in circulation problem), and let f be the maximum flow from S to T . If $f \neq \sum_{v \in V, in(v) > 0} in(v)$, there's no solution. Otherwise, the maximum flow from s to t is the answer. Also, f is a mincost valid flow.
 - To minimize, let f be the maximum flow from S to T . Connect $t \rightarrow s$ with capacity ∞ and let the flow from S to T be f' . If $f + f' \neq \sum_{v \in V, in(v) > 0} in(v)$, there's no solution. Otherwise, f' is the answer.
 - The solution of each edge e is $l_e + f_e$, where f_e corresponds to the flow of edge e on the graph.
- Construct minimum vertex cover from maximum matching M on bipartite graph (X, Y)
 - Redirect every edge: $y \rightarrow x$ if $(x, y) \in M$, $x \rightarrow y$ otherwise.
 - DFS from unmatched vertices in X .
 - $x \in X$ is chosen iff x is unvisited; $y \in Y$ is chosen iff y is visited.
- Minimum cost cyclic flow
 - Construct super source S and sink T
 - For each edge (x, y, c) , connect $x \rightarrow y$ with $(cost, cap) = (c, 1)$ if $c > 0$, otherwise connect $y \rightarrow x$ with $(cost, cap) = (-c, 1)$
 - For each edge with $c < 0$, sum these cost as K , then increase $d(y)$ by 1, decrease $d(x)$ by 1
 - For each vertex v with $d(v) > 0$, connect $S \rightarrow v$ with $(cost, cap) = (0, d(v))$
 - For each vertex v with $d(v) < 0$, connect $v \rightarrow T$ with $(cost, cap) = (0, -d(v))$
 - Flow from S to T , the answer is the cost of the flow $C + K$
- Maximum density induced subgraph
 - Binary search on answer, suppose we're checking answer T
 - Construct a max flow model, let K be the sum of all weights
 - Connect source $s \rightarrow v, v \in G$ with capacity K
 - For each edge (u, v, w) in G , connect $u \rightarrow v$ and $v \rightarrow u$ with capacity w
 - For $v \in G$, connect it with sink $v \rightarrow t$ with capacity $K + 2T - \left(\sum_{e \in E(v)} w(e)\right) - 2w(v)$
 - T is a valid answer if the maximum flow $f < K|V|$
- Minimum weight edge cover
 - For each $v \in V$ create a copy v' , and connect $u' \rightarrow v'$ with weight $w(u, v)$.
 - Connect $v \rightarrow v'$ with weight $2\mu(v)$, where $\mu(v)$ is the cost of the cheapest edge incident to v .
 - Find the minimum weight perfect matching on G' .
- Project selection cheat sheet: S, T 分別代表 0, 1 側，最小化總花費。

| | |
|----------------------------|---|
| i 為 0 時花費 c | (i, T, c) |
| i 為 1 時花費 c | (S, i, c) |
| $i \in I$ 有任何一個為 0 時花費 c | $(i, w, \infty), (w, T, c)$ |
| $i \in I$ 有任何一個為 1 時花費 c | $(S, w, c), (w, i, \infty)$ |
| i 為 0 時得到 c | 直接得到 $c; (S, i, c)$ |
| i 為 1 時得到 c | 直接得到 $c; (i, T, c)$ |
| i 為 0, j 為 1 時花費 c | (i, j, c) |
| i, j 不同時花費 c | $(i, j, c), (j, i, c)$ |
| i, j 同時是 0 時得到 c | 直接得到 $c; (S, w, c), (w, i, \infty), (w, j, \infty)$ |
| i, j 同時是 1 時得到 c | 直接得到 $c; (i, w, \infty), (j, w, \infty), (w, T, c)$ |
- Submodular functions minimization
 - For a function $f: 2^V \rightarrow \mathbb{R}$, f is a submodular function iff
 - $\forall S, T \subseteq V, f(S) + f(T) \geq f(S \cup T) + f(S \cap T)$, or
 - $\forall X \subseteq Y \subseteq V, x \notin Y, f(X \cup \{x\}) - f(X) \geq f(Y \cup \{x\}) - f(Y)$.
 - To minimize $\sum_i \theta_i(x_i) + \sum_{i < j} \phi_{ij}(x_i, x_j) + \sum_{i < j < k} \psi_{ijk}(x_i, x_j, x_k)$
 - If $\theta_i(1) \geq \theta_i(0)$, add edge $(S, i, \theta_i(1) - \theta_i(0))$ and $\theta_i(0)$ to answer; otherwise, $(i, T, \theta_i(0) - \theta_i(1))$ and $\theta_i(1)$.
 - Add edges $(i, j, \phi_{ij}(0, 1) + \phi_{ij}(1, 0) - \phi_{ij}(0, 0) - \phi_{ij}(1, 1))$.
 - Denote x_{ijk} as helper nodes. Let $P = \psi_{ijk}(0, 0, 0) + \psi_{ijk}(0, 1, 1) + \psi_{ijk}(1, 0, 1) + \psi_{ijk}(1, 1, 0) - \psi_{ijk}(0, 0, 1) - \psi_{ijk}(0, 1, 0) - \psi_{ijk}(1, 0, 0) - \psi_{ijk}(1, 1, 1)$. Add $-P$ to answer. If $P \geq 0$, add edges $(i, x_{ijk}, P), (j, x_{ijk}, P), (k, x_{ijk}, P), (x_{ijk}, T, P)$; otherwise $(x_{ijk}, i, -P), (x_{ijk}, j, -P), (x_{ijk}, k, -P), (S, x_{ijk}, -P)$.
 - The minimum cut of this graph will be the the minimum value of the function above.

5.2 Equations

Stirling Number of the First Kind

$S_1(n, k)$ counts the number of permutations of n elements with k disjoint cycles.

- $S_1(n, k) = (n-1) \cdot S_1(n-1, k) + S_1(n-1, k-1)$
- $S_1(n, i) = [x^i] \left(\prod_{i=0}^{n-1} (x+i) \right)$, use D&Q and Taylor shift.

$$S_1(i, k) = \frac{i!}{k!} [x^i] \left(\sum_{j \geq 1} \frac{x^j}{j} \right)^k$$

Stirling Number of the Second Kind

$S_2(n, k)$ counts the number of ways to partition a set of n elements into k nonempty sets.

- $S_2(n, k) = S_2(n-1, k-1) + k \cdot S_2(n-1, k)$
- $S_2(n, k) = \sum_{i=0}^k \binom{n}{i} i^n (-1)^{k-i} = \sum_{i=0}^k \frac{(-1)^i}{i!} \cdot \frac{(k-i)^n}{(k-i)!}$
- $S_2(i, k) = \frac{i!}{k!} [x^i] (e^x - 1)^k$

Derivatives/Integrals

Integration by parts: $\int_a^b f(x)g(x)dx = [F(x)g(x)]_a^b - \int_a^b F(x)g'(x)dx$

$$\left| \begin{array}{l} \frac{d}{dx} \sin^{-1} x = \frac{1}{\sqrt{1-x^2}} \quad \frac{d}{dx} \cos^{-1} x = -\frac{1}{\sqrt{1-x^2}} \quad \frac{d}{dx} \tan^{-1} x = \frac{1}{1+x^2} \\ \frac{d}{dx} \tan x = 1 + \tan^2 x \quad \int \tan ax = -\frac{\ln |\cos ax|}{a} \\ \int e^{-x^2} = \frac{\sqrt{\pi}}{2} \operatorname{erf}(x) \quad \int x e^{ax} dx = \frac{e^{ax}}{a^2} (ax - 1) \end{array} \right|$$

$$\int \sqrt{a^2 + x^2} = \frac{1}{2} \left(x \sqrt{a^2 + x^2} + a^2 \operatorname{asinh}(x/a) \right)$$

Extended Euler

$$a^b \equiv \begin{cases} a^{(b \bmod \varphi(m)) + \varphi(m)} & \text{if } (a, m) \neq 1 \wedge b \geq \varphi(m) \\ a^{b \bmod \varphi(m)} & \text{otherwise} \end{cases} \pmod{m}$$

Pentagonal Number Theorem

$$\prod_{n=1}^{\infty} (1 - x^n) = \sum_{k=-\infty}^{\infty} (-1)^k x^{k(3k-1)/2} = (\sum p(n) x^n)^{-1}$$

5.3 Extended FloorSum

$$g(a, b, c, n) = \sum_{i=0}^n i \left\lfloor \frac{ai+b}{c} \right\rfloor$$

$$= \begin{cases} \left\lfloor \frac{a}{c} \right\rfloor \cdot \frac{n(n+1)(2n+1)}{6} + \left\lfloor \frac{b}{c} \right\rfloor \cdot \frac{n(n+1)}{2} \\ + g(a \bmod c, b \bmod c, c, n), & a \geq c \vee b \geq c \\ 0, & n < 0 \vee a = 0 \\ \frac{1}{2} \cdot (n(n+1)m - f(c, c-b-1, a, m-1) \\ - h(c, c-b-1, a, m-1)), & \text{otherwise} \end{cases}$$

$$h(a, b, c, n) = \sum_{i=0}^n \left\lfloor \frac{ai+b}{c} \right\rfloor^2$$

$$= \begin{cases} \left\lfloor \frac{a}{c} \right\rfloor^2 \cdot \frac{n(n+1)(2n+1)}{6} + \left\lfloor \frac{b}{c} \right\rfloor^2 \cdot (n+1) \\ + \left\lfloor \frac{a}{c} \right\rfloor \cdot \left\lfloor \frac{b}{c} \right\rfloor \cdot n(n+1) \\ + h(a \bmod c, b \bmod c, c, n) \\ + 2 \left\lfloor \frac{a}{c} \right\rfloor \cdot g(a \bmod c, b \bmod c, c, n) \\ + 2 \left\lfloor \frac{b}{c} \right\rfloor \cdot f(a \bmod c, b \bmod c, c, n), & a \geq c \vee b \geq c \\ 0, & n < 0 \vee a = 0 \\ nm(m+1) - 2g(c, c-b-1, a, m-1) \\ - 2f(c, c-b-1, a, m-1) - f(a, b, c, n), & \text{otherwise} \end{cases}$$

5.27 Simplex Construction

Standard form: maximize $\sum_{1 \leq i \leq n} c_i x_i$ such that $\sum_{1 \leq i \leq n} A_{ji} x_i \leq b_j$ for all $1 \leq j \leq m$ and $x_i \geq 0$ for all $1 \leq i \leq n$.

1. In case of minimization, let $c'_i = -c_i$
2. $\sum_{1 \leq i \leq n} A_{ji} x_i \geq b_j \rightarrow \sum_{1 \leq i \leq n} -A_{ji} x_i \leq -b_j$
3. $\sum_{1 \leq i \leq n} A_{ji} x_i = b_j \rightarrow \text{add } \leq \text{ and } \geq$.
4. If x_i has no lower bound, replace x_i with $x_i - x'_i$

} */

```

8 Misc

8.1 Theorems

Spherical Coordinate

$$\begin{aligned}
 x &= r \sin \theta \cos \phi \\
 y &= r \sin \theta \sin \phi \\
 z &= r \cos \theta
 \end{aligned}$$

$$\begin{aligned}
 r &= \sqrt{x^2 + y^2 + z^2} \\
 \theta &= \arccos(z / \sqrt{x^2 + y^2 + z^2}) \\
 \phi &= \operatorname{atan2}(y, x)
 \end{aligned}$$

Spherical Cap

- A portion of a sphere cut off by a plane.
- r : sphere radius, a : radius of the base of the cap, h : height of the cap, θ : $\arcsin(a/r)$.
- Volume = $\pi h^2(3r - h)/3 = \pi h(3a^2 + h^2)/6 = \pi r^3(2 + \cos \theta)(1 - \cos \theta)^2/3$.
- Area = $2\pi rh = \pi(a^2 + h^2) = 2\pi r^2(1 - \cos \theta)$.

Sherman-Morrison formula

$$(A + uv^T)^{-1} = A^{-1} - \frac{A^{-1}uv^TA^{-1}}{1 + v^TA^{-1}u}$$

Kirchhoff's Theorem

Denote L be a $n \times n$ matrix as the Laplacian matrix of graph G , where $L_{ii} = d(i)$, $L_{ij} = -c$ where c is the number of edge (i, j) in G .

- The number of undirected spanning in G is $\det(\tilde{L}_{11})$.
- The number of directed spanning tree rooted at r in G is $\det(\tilde{L}_{rr})$.

BEST Theorem

$$\#\{\text{Eulerian circuits}\} = \#\{\text{arborescences rooted at } 1\} \cdot \prod_{v \in V} (\deg(v) - 1)!$$

Random Walk on Graph

Let P be the transition matrix of a strongly connected directed graph, $\sum_j P_{i,j} = 1$. Let $F_{i,j}$ be the expected time to reach j from i . Let g_i be the expected time from i to i , $G = \text{diag}(g)$ and J be a matrix all of 1, i.e. $J_{i,j} = 1$. Then, $F = J - G + PF$.

First solve G : let $\pi P = \pi$ be a stationary distribution. Then $\pi_i g_i = 1$. The rank of $I - P$ is $n - 1$, so we first solve a special solution X such that $(I - P)X = J - G$ and adjust X to F by $F_{i,j} = X_{i,j} - X_{j,j}$.

Tutte Matrix

For $i < j$, $d_{ij} = x_{ij}$ (in practice, a random number) if $(i, j) \in E$, otherwise $d_{ij} = 0$. For $i \geq j$, $d_{ij} = -d_{ji} \cdot \frac{\text{rank}(D)}{2}$ is the maximum matching.

Cayley's Formula

- Given a degree sequence d_1, d_2, \dots, d_n for each labeled vertices, there're $\frac{(n-2)!}{(d_1-1)!(d_2-1)!\dots(d_n-1)!}$ spanning trees.

- Let $T_{n,k}$ be the number of labeled forests on n vertices with k components, such that vertex $1, 2, \dots, k$ belong to different components. Then $T_{n,k} = kn^{n-k-1}$.

Erdős-Gallai theorem

A sequence of non-negative integers $d_1 \geq d_2 \geq \dots \geq d_n$ can be represented as the degree sequence of a finite simple graph on n vertices if and only if $d_1 + d_2 + \dots + d_n$ is even and $\sum_{i=1}^k d_i \leq k(k-1) + \sum_{i=k+1}^n \min(d_i, k)$ holds for all $1 \leq k \leq n$.

Havel-Hakimi algorithm

Find the vertex who has greatest degree unused, connect it with other greatest vertex.

Gale-Ryser theorem

A pair of sequences of nonnegative integers $a_1 \geq \dots \geq a_n$ and b_1, \dots, b_n is bigraphic if and only if $\sum_{i=1}^n a_i = \sum_{i=1}^n b_i$ and $\sum_{i=1}^k a_i \leq \sum_{i=1}^n \min(b_i, k)$ holds for every $1 \leq k \leq n$.

Fulkerson-Chen-Anstee theorem

A sequence $(a_1, b_1), \dots, (a_n, b_n)$ of nonnegative integer pairs with $a_1 \geq \dots \geq a_n$ is digraphic if and only if $\sum_{i=1}^n a_i = \sum_{i=1}^n b_i$ and $\sum_{i=1}^k a_i \leq \sum_{i=1}^k \min(b_i, k-1) + \sum_{i=k+1}^n \min(b_i, k)$ holds for every $1 \leq k \leq n$.

Euler's planar graph formula

$$V - E + F = C + 1, E \leq 3V - 6 \text{ (when } V \geq 3)$$

Pick's theorem

For simple polygon, when points are all integer, we have $A = \#\{\text{lattice points in the interior}\} + \frac{1}{2}\#\{\text{lattice points on the boundary}\} - 1$

Matroid

- $B \subseteq A \wedge A \in \mathcal{I} \Rightarrow B \in \mathcal{I}$.
- If $A, B \in \mathcal{I}$ and $|A| > |B|$, then $\exists x \in A \setminus B, B \cup \{x\} \in \mathcal{I}$.
- Linear matroid $A \in \mathcal{I}$ iff linear indep.
- Graphic matroid \mathcal{I} = forests of undirected graph
- Colorful matroid (EX) Each color c has an upper bound R_c .
- Transversal matroid $A \in \mathcal{I}$ iff \exists matching M whose right part is A .
- Bond matroid $A \in \mathcal{I}$ iff G is connected after removing edges A .
- Dual matroid $A \in \mathcal{I}^*$ iff there is a basis $\subseteq E \setminus A$
- Truncated matroid $A \in \mathcal{I}'$ iff $A \in \mathcal{I} \wedge |A| \leq k$

Matroid Intersection

Given matroids $M_1 = (G, \mathcal{I}_1), M_2 = (G, \mathcal{I}_2)$, find maximum $S \in \mathcal{I}_1 \cap \mathcal{I}_2$. For each iteration, build the directed graph and find a shortest path from s to t .

- $s \rightarrow x : S \cup \{x\} \in \mathcal{I}_1$
- $x \rightarrow t : S \cup \{x\} \in \mathcal{I}_2$
- $y \rightarrow x : S \setminus \{y\} \cup \{x\} \in \mathcal{I}_1$ (y is in the unique circuit of $S \cup \{x\}$)
- $x \rightarrow y : S \setminus \{y\} \cup \{x\} \in \mathcal{I}_2$ (y is in the unique circuit of $S \cup \{x\}$)

Alternate the path, and $|S|$ will increase by 1. In each iteration, $|E| = O(RN)$, where $R = \min(\text{rank}(\mathcal{I}_1), \text{rank}(\mathcal{I}_2)), N = |G|$. For weighted case, assign weight $-w(x)$ and $w(x)$ to $x \in S$ and $x \notin S$, resp. Find the shortest path by Bellman-Ford. The maximum iteration of Bellman-Ford is $2R + 1$.

Dual of LP

| Primal | Dual |
|---|--|
| Maximize $c^T x$ s.t. $Ax \leq b, x \geq 0$ | Minimize $b^T y$ s.t. $A^T y \geq c, y \geq 0$ |
| Maximize $c^T x$ s.t. $Ax \leq b$ | Minimize $b^T y$ s.t. $A^T y = c, y \geq 0$ |
| Maximize $c^T x$ s.t. $Ax = b, x \geq 0$ | Minimize $b^T y$ s.t. $A^T y \geq c$ |

Dual of Min Cost b-Flow

- Capacity c_{uv} , Flow f_{uv} , Cost w_{uv} , Required Flow difference for vertex b_u .
- If all w_{uv} are integers, then optimal solution can happen when all p_u are integers.

$$\min \sum_{uv} w_{uv} f_{uv} \text{ s.t. } -f_{uv} \geq -c_{uv}, \sum_v f_{vu} - \sum_v f_{uv} = -b_u$$

$$\Leftrightarrow \min \sum_u b_u p_u + \sum_{uv} c_{uv} \max(0, p_v - p_u - w_{uv}) \text{ s.t. } p_u \geq 0$$

Minimax Theorem

Let $f : X \times Y \rightarrow \mathbb{R}$ be continuous where $X \subseteq \mathbb{R}^n, Y \subseteq \mathbb{R}^m$ are compact and convex. If $f(\cdot, y) : X \rightarrow \mathbb{R}$ is concave for fixed y , and $f(x, \cdot) : Y \rightarrow \mathbb{R}$ is convex for fixed x , then $\max_{x \in X} \min_{y \in Y} f(x, y) = \min_{y \in Y} \max_{x \in X} f(x, y)$, e.g. $f(x, y) = x^T A y$ for zero-sum matrix game.

Parallel Axis Theorem

The second moment of area is $I_z = \iint x^2 + y^2 dA$. $I_{z'} = I_z + Ad^2$ where d is the distance between two parallel axis z, z' .

8.2 Stable Marriage

- 1: Initialize $m \in M$ and $w \in W$ to free
- 2: while \exists free man m who has a woman w to propose to do
- 3: $w \leftarrow$ first woman on m 's list to whom m has not yet proposed
- 4: if \exists some pair (m', w) then
- 5: if w prefers m to m' then
- 6: $m' \leftarrow$ free
- 7: $(m, w) \leftarrow$ engaged
- 8: end if
- 9: else
- 10: $(m, w) \leftarrow$ engaged
- 11: end if
- 12: end while
